SPOKEN SUMMARY

As of the 2026-10-07 close. Every series posted this session. The environment dial reads 54 and the state is IN, 363 sessions in. Base 60, minus 8 for equity implied vol cheap against credit realized vol, minus 5 for month-long rates pressure with the VIX asleep, minus 3 for VIX and VVIX both on the floor and plus 10 for the flip confirmation. OUT needs 20 or below; back IN above 35. In the IN state since 2008 the odds of a five percent drop within a month were 14 percent and of a ten percent drop within a quarter 12 percent, with a mean next quarter of +3.1 percent.

The main rule board is empty: nothing live, nothing fired in the last ten sessions. The ticker pair board is empty: nothing live, nothing fired in the last ten sessions. On the realized-vol board, live: equity implied vol cheap against credit realized vol.

VIX 15.08, 12th percentile of the year, five-day rate of change z -0.58, twenty-one-day -0.20. VVIX-to-VIX five-day rate of change z +0.12, with VVIX itself at the 2nd percentile. There is no spike to discriminate. If the VIX jumps from here, the question is whether VVIX keeps pace: lagging is onset, keeping up is a dip.

Ten-year at 5.28 percent, 99th percentile, five-day change z -0.46, twenty-one-day +2.43. Thirty-year at 5.66, 100th percentile, five-day +0.06, twenty-one-day +2.48. The five-day rates setup is not live. The month-long rates pressure context is live and counting in the dial. Bond vol is at the 95th percentile, five-day z -0.81, twenty-one-day +1.56.

Realized: SPY ten-day realized 7.8, twenty-one-day 10.2, term structure 0.76 at z -0.96. Realized-vol breadth 0 percent of the thirty-eight with short realized expanding, z -1.02. VIX minus realized premium five-day change z -0.18. VIX over high-yield realized vol sits at the 10th percentile, the cheap-credit-vol bucket that carried about thirty percent odds of a five percent drawdown inside a month.

Breadth, context only and not in the dial. Equal-weight S&P -4.2 percent against cap-weight over twenty-one sessions, ratio rate of change z -1.58, and -4.6 percent over sixty-three, z -1.05. Equal-weight Nasdaq -3.5 and -3.5 percent, z -1.45 and -0.87. Three of nine sectors have equal weight ahead over the month. Live cells: equal weight losing a month into a yield rip since 2026-09-18 and equal weight losing a quarter into a yield rip since 2026-10-07. Historically those cells carried 33 percent and 41 percent odds of a five percent drawdown inside a month.

Dimension tags printed in the last five sessions: rate-led and equity only.

Backtest context for the dial: fully invested when IN and in cash when OUT since 2008 returned 14.7 percent a year at 14.77 percent vol with a maximum drawdown of -20.9 percent, against buy-and-hold 10.9 percent at 18.58 percent vol and -73.1 percent. About 2.3 state changes a year.

Rates of change are log changes over 1 to 21 sessions, z-scored against each series' own trailing 252 sessions. P(5% DD/21d) is the share of days after which SPY fell 5% or more within 21 sessions; base rate 0.174. The dial is base 60 plus rule points that persist for each rule's window; the state is OUT at 20 or below and returns to IN only above 35. Breadth and volume are reported as context and carry no weight in the dial. Source: Yahoo via the yfinance fork; ^VIX1Y and ^RVX are not served and are excluded.
